human; enzyme; motor domain; kinesin-like DNA binding protein; KID; cytostatic; cardiant; immunomodulator; antiinflammatory; gene therapy; cancer; hyperplasia; restenosis; cellular proliferation disorder; cardiac hypertrophy; immune disorder; inflammation. Human kinesin-like DNA binding protein (KID) (SeqID 4). /note= "Encoded by CA" Location/Qualifiers Ź ADC23340 standard; protein; 512 20-APR-1999; 99US-00295612. 20-JUN-2000; 2000US-00597292. 28-NOV-2000; 2000US-00724224 entry) (CYTO-) CYTOKINETICS INC

Identifying a candidate agent as modulator of function of a target protein for treating cellular proliferation disorders by adding a candidate agent to a maxure of the target protein that directly/indirectly produces ADP or phosphate.

Claim 1; SEQ ID NO 4; 26pp; English.

This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor

```
domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antinfiammastories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 4) of the invention.
                                                                                                                                                                                                                                                                                                                            Sequence 512 AA;

```
The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating callular screening for modulators of motor proteins useful for treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and classases, arthritis, graft rejection, inflammatory bowel disease and angioplasty. This sequence represents a human microtubule motor protein of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:3, but this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NQRSSRSHAVLLVKVDQRERLAPFRQREGKLYLIDLAGSEDNRRTGNKGLRLKESGAINT 300

Modulating expression of a Thanatos (death)-Associated Protein (THAP) responsive gene for preventing or treating e.g. cancer or inflammation, comprises modulating the interaction of a THAP polypeptide with a nucleic acid.

Example 47; SEQ ID NO 425; 612pp; English.

The present invention describes a method for modulating the expression of a thanatos (death)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP family polypoptide or its biological fragment with a nucleic acid, and so enhancing or repressing the expression of the THAP responsive gene. Also described: (1) a method of modulating the expression of a gene responsive or THAP/ChemoKine complex; (2) a pharmaceutical composition comprising a THAP responsive element in a pharmaceutical carrier; (3) a transcription factor decoy consisting essentially of a THAP responsive element; (4) a call comprising a transcription factor decoy described above; (5) methods of modulating the interaction between a nucleic acid and a THAP-family comprising a transcription factor decoy described above; (6) methods of modulating the interaction between a nucleic acid and a THAP-family collypeptide or its biological fragment, or a nucleic acid and a THAP-family polypeptide or its biological coll comprising a viral vector which comprises a promoter operably linked to a nucleic acid encoding a THAP-family polypeptide or its biological fragment; (7) a method of constructing a cell which expresses a recombinant THAP-family polypeptide, (8) a method of ameliorating symptoms associated with a condition mediated by a THAP/Chemokine complex

ta a THAP responsive element or that modulates transcription

c at a THAP responsive element or that modulates the transport of a

c chemokine into the nucleus; (10) methods for reducing the symptoms

c associated with a condition selected from excessive or insufficient

angiogenesis, inflammation, metastasis of acarcerous tissue, excessive

cc insufficient apoptosis, cardiovascular disease and neurodegenerative

diseases; symptoms associated with a condition resulting from the

cc activity of a chemokine or a THAP-family polypeptide in an individual; or

mediated by a THAP-family polypeptide in an individual; (11) a vector

c symptoms associated with transcriptional repression or activation

cc modising a THAP-family polypeptide in an individual; (11) a vector

c comprising a THAP-family polypeptide in an individual; (11) a vector

c comprising the vector described above or that expresses a THAP-family

comprising the vector described above or that expresses a THAP-family

comprising the vector described above or that expresses a THAP-family

comprising the vector described above or that expresses a THAP-family

comprising an nucleic acid comprising a THAP responsive promoter,

craction comprrising a nucleic acid comprising a THAP responsive promoter,

craction has antiangiogenic, antinflammatory, cardiovascular,

cytostatic, neuroprotective and osteopathic activities, and can be used

c as a THAP and THAP synthesis modulator. The composition can be used for modulating the expression of a THAP responsive gene. Modulation us useful

composition has present sequence is used in the exemplification of the

confidence or insufficient apoptosis, cardiovascular disease or neurodegenerative

confidence or insufficient apoptosis, cardiovascular disease or neurodegenerative

confidence or invarion 8888888888888888888888888888888888

                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This, polypeptide sequence is human KID protein (SeqID 8) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      147 VIPRALMDLLQLTREEGAEGRPWALSVTMSYLEIYQEKVLDLLDPASGDLVIREDCRGNI 206

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target proteins, methods to identify candidate agents that bind to a target biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for
                                                                                                                                       446

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (b); (c) hybridizes under stringent conditions to (a) and cc encodes a naturally occurring kinase polypeptide; (d) encodes the cc polypeptide in (a), except that it lacks one or more, but not all, of an complement of comman, a catalytic domain, a C- terminal domain, a colled-coll structure region, a spacer region and a C- terminal domain, a colled-coll structure region, a spacer region and a C- cc terminal tail; or (e) is a acomplement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or curronal-associated diseases, and metabolic disorder: The disorders are cc preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, bain, bacteria, infections and electosis, amyoricrophic lateral sclerosis, ciral infections infections caused by fungi, ocular diseases, migraines, pain, bacteria, infections and disorders, attention disorders, cognition disorders, hypotension, hyperrension, psychotic disorders, neurological disorders, dyskinesias, metabolic disorders and organ transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             182

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57331 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                        Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.

```
This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of traget proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomedulators and antinfilammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 2) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      242

The invention traces to numeral mistorubuse muctor processing and the invention traces to numeral mistorubuse motor protein and also relates to a method of screening cativity, a method of testing for ATPase activity of microtubule motor protein which has microtubule stimulated ATPase activity, a method of testing for ATPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cardiac hypertrophy, immune disorders and inflammation, for treating alsorders as conserving the remaining disorders as sociated with KID and for inhibiting KID and for treating autoimmune cassociated with KID and for inhibiting KID and for treating autoimmune cassociated with KID and for inhibiting kID and for treating autoimmune cassociated with KID and for inhibiting KID and for treating autoimmune cassociated with KID and for inhibiting kID and for treating autoimmune continued as any protein subject to interest the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:1, but this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         122

                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of traget proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using method or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 6) of the invention.
                                                                                                                                                                                                                                             human; enzyme; motor domain; kinesin-like DNA binding protein; KID; cytostatic; cardiant; immunomodulator; antiinflammatory; gene therapy; cancer; hyperplasia; restenosis; cellular proliferation disorder; cardiac hypertrophy; immune disorder; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a candidate agent as modulator of function of a target protein for treating cellular proliferation disorders by adding a candidate agent to a mixture of the target protein that directly/indirectly produces ADP or phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 346;
                                                                                                                                                                                                                    Human kinesin-like DNA binding protein (KID) (SeqID 6).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ATPasse activity, a method of testing for ATPasse activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein, methods to identify candidate agents that bind to a target protein, modulators of the target cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA and inflammation for inhibiting KDD. The sequences are used for screening for modulators of motor proteins useful for treating callular screening for modulators of motor proteins useful for treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders

          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher elucidations for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16175, and the encoded proteins (ABB57737-Sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80
                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA 4BBT2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   388 KLSQKEL-LGPPEAKRARGPEEEIGSPEPMAAPASASQKLSPLOKLSSMDPAMLERLLS

```

The invention elates to novel isolated, enriched or purified nucleic acid molecule molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (a); (c) hybridizes under stringent conditions to (a) and coordes a naturally occurring kinase polypeptide; (d) encodes the coorditions to (a) and coordes an atural domain, a coiled-coil structure region, a spacer region and a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers. Immune-related diseases or disorders, cardiovascular disease, brain or enuronal-associated diseases, and metabolic disorders. The disorders are preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, brain, viral infections infections caused by fungi, ocular diseases, migraines, pain, sexual dysfunction, mood disorders, anyoricrophic lateral sclerosis, corteria, infections caused by fungi, ocular diseases, metrological disorders, dyskinesias, metabolic disorders, neurological disorders, dyskinesias, metabolic disorders and organ transplant cried to the corresponds to one of the kinase polypeptides of 13; New isolated, enriched or purified nucleic acid molecule encoding a kinase polypeptide, useful for treating cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated diseases and Gaps 59; Indels Query Match
22.3%; Score 578.5; DB 7;

The invention relates to an isolated polynuclectide (a) comprising any of the 666 fully defined nucleotide sequences appearing as ADD49269 ADD49935, ADD49936 and ADD49938, complements of (a); sequences of at least 20 contiguous residues of (a); sequences that hybridise to (a) the following sequences having at least 75 or 90% identity to (a); or degenerate variants of (a). Also included are an isolated polypeptide (b) (comprising; sequences encoded by the new polynucleotide; any of the 4 amino acid sequences fully defined in the specification; or sequences having at least 70 or 98% identity to the sequence in (a) or (b)), an expression vector comprising the above polynucleotide operably linked to an expression control sequence, a host cell transformed or transfected with the above expression vector; an isolated antibody, or its antigen-binding fragment, that specifically binds to the above polypeptide, an oligonucleotide that hybridises to the chinds much much of actions and expression expression expression of the conditions, a finite management conditions. polypeptide, polyuciectide or antigen-presenting cells that express the polymeriating to an antigen-presenting cells that express the polymucleotide, under conditions and for a time sufficient to permit the entimulation and/or expansion of T-cells), an isolated T-cell population comprising T-cells prepared by the method, a composition comprising a first component selected from physiological carriers and immunostimulants, and a second component selected from the above polypeptide, polymucleotide, antibody, fusion protein, T-cell population and antigen-presenting cells that express the above polypeptide, crimulating an immunos in a patient (comprising administering to the patient the above composition) treating lung cancer in a patient (comprising administering to the patient the above composition and at least one antibody cited above and a detection reagent, where the detection reagent comprises a reporter group). The composition and attended are useful in diagnosing, preventing and treating cancer, particularly lung cancer. The present sequence is a lung cancer. tunion protein comprising at least one polypoptide cited above, detecting the presence of a cancer in a patient (comprising: obtaining a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypoptide, or with the oligonucleotide cited above; detecting in the sample an amount of the polypoptide that binding agent, or an amount of a polymucleotide that binds to the binding agent, or an amount of a polymucleotide that binds to polymucleotide that by bridises to polymucleotide that hybridises to polymucleotide that hybridises to the oligonucleotide, or polymucleotide that hybridises to the oligonucleotide that hybridises to the polymucleotide, or polymucleotide that hybridises to the oligonucleotide, to a predetermined cut. off value and then determining the presence of a cancer in the patient), a method for stimulating and/or expanding T-cells specific for a tumour protein (comprising contacting T-cells with the above

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
